Instructions – Standard MouseGlider

1) Cut, remove, or tear the break-off tabs of the forearm protector from the MouseGlider**.**

2) Lay the MouseGlider plastic side down and insert and center the mouse into the MouseGlider's opening. Now enjoy a friction free glide system.

For the best performance, try and keep the mouse centered in the MouseGlider's opening when initially grasping or using the mouse. This will become second nature the more you use the MouseGlider™ System.

See demo video on YouTube here: http://youtu.be/Um3_uQazykg

Note: if needed, this is how you attach the included forearm protector into the MouseGlider.

Note: to eliminate rubbing from a low mounted mouse cord, you might have to trim the foam toe of the MouseGlider as shown below. This modification also works well when you have a mouse that has a longer than normal body. By doing this modification, you can give longer bodied mice more vertical freedom of movement.

Foam Toe Cutout for low mounted corded or long bodied mice

Alternate modification would be to cut the foam and plastic for more vertical movement

Use as is out of the box
